Dual TV sound demodulator circuits

TDA2555
TDA2557

GENERAL DESCRIPTION

The circuits incorporate two FM demodulator systems to perform the demodulator functions required in a dual sound carrier TV system for demodulating the sound carriers.

The difference between TDA2555 and TDA2557 is the number of stages of the limiting amplifier.

- Eight (TDA2555) or five (TDA2557) stage limiting amplifier
- Quadrature demodulator for FM detection
- De-emphasis stage
- Output amplifier
- Mute function for each FM demodulator

Notes to the characteristics

1. THD < 0,1% requires a double tuned demodulator circuit ($Q_L = 20$). With a single tuned circuit a THD of < 0,5% is possible (see Fig.1 and Fig.3).
2. If higher a.c. output current is required an external resistor must be applied from output (pins 2 and 8) to ground (min. 2 kΩ) in order to improve the THD performance ($-I_{2,8} < 4 \text{ mA}$).
3. The de-emphasis time constant is 50 µs.
4. Crosstalk attenuation is defined as: $a_{12} = \frac{V_{2-14} - V_{1-4}}{V_{8-14}}$
5. In the MUTE state the a.f. output level attenuation is more than 60 dB. The MUTE function is only guaranteed for an r.m.s. value of the input voltage lower than 60 mV. See also Fig.2.
